

Pointers in C

Basics of pointer :-

`int x = 10;`

- ①  ← Memory Block
- ②  ← Name of Memory Block
- ③  ← Value in memory Block
- ④  ← address of memory Block.
(location)

To print address of x :-

```
main()
{
    int x = 10;
    printf("%d", x);
    printf("%d", &x);
}
```

address operator.

- ① & is known as address of operator.
- ② It is an unary operator.
- ③ It is also known as referencing operator.

Indirection Operator:-

***** is Indirection operator
↳ also known as dereferencing operator.
↓
Value at

Example:-

```
main()
{
    int x=10;
    printf("%d", x); - ①
    printf("%d", &x); - ②
    printf("%d\n", *&x); - ③
}
```

x
10

→ 1024

10
1024
10

Note:-

```
int x=10;
&x = 20; → error
```

↓
constant

we can not store anything in address of x.

→ ②

```
int x=5;
j = &x;
```

↳ correct.

x
5

1024

j
1024

3000

int *j;

we can store address in other variable. we need to declare it.

Pointer:-

→ pointer is a variable that contains address of another variable.
→ pointer always consumes 2 bytes in memory.

Question:-

main()

```
{ int x=5, *j;  
  j = &x;
```

```
  printf("%d %u\n", x, j);
```

```
  printf("%d %u", *j, &x);
```

```
  printf("%u", *&j);  
}
```

%u → unsigned integer
→ 0 to 65535
